

# NO ACCIDENTS WITH SGS

## SAFETY FIRST

Activities can be hectic on a building site, factory floor, storage site or yard. This applies to construction activities, maintenance, repair and restoration work as well as demolition.

On the shop floor or construction site, many employees are working together and beside each other. They could be your own personnel or work for

subcontractors. All these people work and walk around each other, using various materials and equipment.

- Is it all safe?
- Are all danger zones indicated and is there sufficient protection against such hazards like falling objects or people?

An accident may have disastrous consequences for employees, bystanders and your organisation. A stoppage or interruption can also cost a great deal of money. Realising safety requires experience, personnel and time.

SGS is pleased to take safety coordination and monitoring off your hands.

# WORKING ON SAFETY IN THE SHOP AND ON SITE

## BRING IN SGS

Call the SGS professionals for the whole construction process or just peak periods.

If you are not able to take on the extra activities and you need everyone for daily operations, SGS makes time for your safety and dispatches experienced and qualified safety coordinators to your building site or factory.

## ONE CONCERN LESS

SGS works for building commissioners, main contractors and construction companies.

For industrial or public building work, SGS coordinates the preparation of the project as well as the coordination of all safety activities on site.

SGS draws up health and safety plans and verifies any existing or proposed plans. If necessary we advise on adaptations and implement them as the activities progress.

## FULL SERVICES

- Safety coordination during the design and construction phases
- Advices in preventive measures
- Drawing up of coordination documents
- Advice on quotations
- Safety supervision
- Development of health and safety plans
- Internal license controls

- Verification of access permits
- Access controls for designed areas (e.g. gas storage, confined spaces)
- Certificate control for cranes and operators
- Control of collective protection (safe scaffolding, lifelines, etc.)
- Control of personnel protection equipment (helmets, gloves, shoes, etc.)
- Safety signalling control
- Determination of transfer/clearing routes
- The supply of external HSE coordinators
- Advice/coordination concerning Occupational Health and Safety regulations

## COURSES

SGS offers a broad range of relevant safety training courses. With the acquired knowledge, your employees can then take care of the safety aspects in a practical and efficient way and are able to respond to the ever-changing environment.
