

## ROMANIA

### NEW LABORATORY IN CONSTANTA OPENS FOR THE 2013 SEASON

The aflatoxins content of the 2012 corn crop was a challenge for both traders and surveyors. It was a challenge to sample, prepare samples and check the content of aflatoxins to enable us to deliver high quality results at short notice. The second half of the 2012 season was a difficult period for everyone involved in this business.

In readiness for the 2013 season, and to prepare for any new Mycotoxins issues in cereals, SGS Romania is installing an HPLC device to operate alongside the existing ELISA facilities in the Constanta laboratory. The installation should be complete by the end of June.

In addition, to meet increased demand for testing services, the new laboratory has more space and more equipment, enabling us to handle a larger volume of the most requested analyses. The move to the new facility took place during April and all works relating to new equipment installations will be complete in early July.

As a GAFTA/FOSFA analyst, SGS Romania will be quicker and be able to perform more analyses at the same time.

As a GAFTA/FOSFA superintendent, we are ready to perform supervision activity during vessel loading/discharging in Constanta and Braila, on barges at any port along the Danube, on trucks/trains and any other inland activity.

As a GAFTA fumigator, we can perform fumigation by probing, in sleeves and by recirculation.

Through our commercial team we will keep in touch with our clients, increase efficiency and support our partners.
